

Description: SkyBell HD Wedge Mounting Plate is used to adjust the angle of the SkyBell HD WiFi Video Doorbell device to provide optimal viewing. The SkyBell HD device has a 180° field of view, but may be further enhanced with the use of the Wedge to more finely adjust the view for a particular installation. It is especially useful when the SkyBell HD device is mounted at a recessed angle to the plane of the door.

The Wedge is designed to provide for fine adjustments of the SkyBell HD viewing angle by freely rotating the wedge while the SkyBell HD is being held in place, prior to anchoring the wedge to the mounting surface. The maximum adjustment is approximately 12.0° in a single direction. The wedge is not required for standard SkyBell HD installation.

Installation Guidance: For successful installation, the back of the Wedge is to be mounted against the wall surface; the standard mounting plate to be placed over the top. The center raised ring of the wedge fits inside of the standard mounting plate to provide a flush fit allowing it to rotate without turning the standard mounting plate. The wedge may be rotated to provide the desired angle prior to anchoring the combined plates. When the combined plates are in the desired angle pointed in the right direction, and the power wires are threaded through the center, then anchor the plates to the wall allowing access to the 2 power terminals on the standard mounting plate. (See diagram for reference).

Kit Contents:

- SkyBell Wedge Mount Plate
- Hardware packet:
 - 2 mounting screws
 - 2 wall anchors

Country of Origin: China
